Question 8. Do you routinely feed back MRSA-related data to frontline staff and physicians? (e.g., incidence, prevalence, compliance with prevention practices)

You indicated that you do not routinely feed back MRSA-related data to frontline staff, which includes physicians. While collecting MRSA-related data is key to measuring success, it is imperative that the staff, especially those on the frontline, are aware of it. Data transparency can help motivate and engage staff at all stages of the initiative, as well as encourage them to continue the changes, promoting sustainability. Simply put, feedback improves motivation and learning. Feed back hospital intervention data, as well as data from comparable hospitals and national aggregates. Simple run charts or a MRSA scorecard are great ways to quickly display and easily communicate data to both frontline staff and senior leaders.

A. Feedback Mechanisms

- MRSA scorecard: Tracks hospital or unit progress towards achieving their MRSA prevention goals; it should be displayed throughout the unit or hospital for all staff to see
- Hospital newsletters
- Hospital electronic communications
- Staff educational events
- New employee orientation
- Staff meetings
- Unit huddles

B. Keys to Giving Effective Feedback

- For feedback to be effective, it should be:
  - Timely. Feedback should be at least monthly or more often if possible. If you wait too long to provide feedback key details are forgotten and/or the feedback loses its meaning.
  - Individualized. Feedback should relate to a specific situation, task, or individual. The more specific the feedback, the more the individual, unit, etc. will be able to correct or modify their performance to improve.

* Note. While this guide focuses on MRSA prevention, these strategies can be applied to the prevention of other multidrug-resistant organisms (MDROs)
o **Customizable.** Feedback should be detailed to the improvement goals of the individual, unit or organization. Different processes or data should be shared or highlighted depending on the targeted improvement goals.

o **Non-punitive.** Feedback should be about performance of a specific situation or task; it should never be personal or about personality. Rather, feedback should be about achieving improvement goals.

- Don’t limit feedback to numbers, e.g., just MRSA bloodstream infection rates; share details to help make it more meaningful. Instead, consider sharing the days the hospital or unit has gone without a MRSA bloodstream infection. Consider using stories or pictures to help remind staff that each infection correlates to harm to a patient.

- When communicating MRSA-related data to staff consider the audience and tailor what is shared to their needs. For example, complex rates or SIRs may be confusing for frontline staff, so instead consider sharing new monthly MRSA bloodstream cases with ancillary unit staff; MRSA rates and hospital SIR may be more appropriate to share with the infection preventionist and the infection prevention and control committee.

- Highlight and celebrate successes, no matter how small. Consider rewarding staff for positive changes or making steps toward their MRSA prevention goals.
